-!- FUNCTION: PRODUCES NITRIC OXIDE (NO) WHICH IS A MESSENGER MOLECULE WITH DIVERSE FUNCTIONS. THRACOPHAGES, NO MEDIATES TUMORICIDAL AND BACTERICIDAL ACTIONS. MAY BE INVOLVED IN THE PATHOGENESIS OF DILATED CARDIOMYOPATHY OR OF EXERCISE INTOLERANCE OBSERVED IN PATIENTS WITH CHRONIC HEART FAILURE.
-!- CATALYTIC ACTIVITY: L-ARGININE + N NADPH + M O(2) = CITRULLINE + NITRIC OXIDE + N NADP(+).
-!- COFACTOR: HEME. BINDS ONE MOLE EACH OF FAD AND FMN. ALSO REQUIRES TETRAHYDROBIOPTERIN (BH4) WHICH MAY STABILIZE THE DIMERIC FORM OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          HEME (BY SIMILARITY).

chem. J. 333:795-799(1998). FUNCTION: PRODUCES NITRIC OXIDE (NO) WHICH IS A MESSENGER MOLECULE WITH DIVERSE FUNCTIONS THROUGHOUT THE BODY.
                                                                                            -:- CATALYTIC ACTIVITY: L-ARGININE + N NADPH + M O(2) = CITRULLINE + NITRIC OXIDE + N NADP(+).

-:- COPACTOR: HEME. BINDS ONE MOLE EACH OF FAD AND FWN. ALSO REQUIRES TETRAHYDROSIOPTERIN (BH4) WHICH MAY STABILIZE THE DIMERIC FORM OF THE ENZYME (BY SIMILARITY).

-:- ENZYME REGULATION: REGULATED BY CALCIUM/CALMODULIN (IN CONTRAST
                                                                                                                                                                                                                                                                                                                                           -i- SUBUNIT: HOMODIMER (BY SIMILARITY).
-i- TISSUE SPECIFICITY: EXPRESSED IN THE LUNG AND COLON. NOT DETECTED IN THE HEART, AORTA, LIVER, KIDNEY, AND SPLEEN.
-i- INDUCTION: BY LIPOPOLYSACCHARIDE (LPS) IN KIDNEY, SPLEEN, AND COLON. EXPRESSION IS REDUCED IN THE PRESENCE OF LPS IN LUNG.
-i- SIMILARITY: BELONGS TO THE NOS FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oxidoreductase; NADP; FAD; FMN; Calcium-binding; Calmodulin-binding; Heme; Multigene family.

NITRIC-OXIDE SYNTHASE, ENDOTHELIAL (EC 1.14.13.39) (EC-NOS) (NOS, TYPE (FRAGMENTS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TISSUE SPECIFICITY: EXPRESSED CONSTITUTIVELY BY VASCULAR RENOTHELIUM. DETECTED IN ALVEOLAR AND SEROSAL EPITHELIAL CELLS AS WELL AS IN ENDOTHELIAL CELLS IN ONE DAY OLD RAT. IN ADULT LUNG, DETECTED IN RARE ENDOTHELIAL CELLS.

BEYELOPHENTAL STAGE: DETECTED AT HIGH LEVELS IN LUNG DURING THE LATE FETAL AND POSTNATAL PERIOD AT LOWER LEVELS IN ADULT. SIMILARLY: BELONGS TO THE NOS FAMILY:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             'Downregulation of endothelial nitric oxide synthase (NOS III) in rat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      STRAIN-SPRAGUE-DAWLEY, TISSUE-Lung; MEDLINE-SPRAGUE-DAWLEY, TISSUE-Lung; MEDLINE-95250990; PubMed-7537461; Kawai N., Bloch D.B., Filippov G., Rabkina D., Suen H.C., Losty P.D., Janssens S.P., Zapol W.M., de la Monte S., Bloch K.D.; "Constitutive endothelial nitric oxide synthase gene expression is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PROMOTES BLOOD CLOTTING THROUGH THE ACTIVATION OF PLATELETS.
CATALYTIC ACTIVITY: L-ARGININE + N NADPH + M O(2) = CITRULLINE +
NITRIC OXIDE + N NADP(+).

1- FUNCTION: FUNCTIONS AS A FATTY ACID MONOXYGENASE CATALYSES

HYDROXYLATION OF MEDIUM AND LONG-CHAIN FATTY ACIDS AT OMEGA-1,

OMEGA-2 AND OMEGA-3 POSITIONS, WITH OPPIMMY CHAIL LENGTHS OF 14-16

CARBONS (LAURIC, MYRASTIC, AND PALMITIC ACIDS). THE REDUCTASE

DOMAIN IS REQUIRED FOR ELECTRON TRANSFER FROM NADP TO CYTOCHROME
                                                                                                                                     "Crystal structure of hemoprotein domain of P450BM-3, a prototype for microsomal P450's."; Science 261:731-736(1993).

Hum. Genet. 103:65-69(1998).

-!- FUNCTION: PRODUCES NITRIC OXIDE (NO) WHICH IS IMPLICATED IN VASCULAR SMOOTH MUSCLE RELAXATION THROUGH A CGMP-MEDIATED SIGNAL TRANSDUCTION PATHWAY. NO MEDIATES VASCULAR ENDOTHELIAL GROWTH FACTOR (VEGF)-INDUCED ANGIOGENEETS IN CORONARY VESSELS AND PROMOTES BLOOD CLOTTING THROUGH THE ACTIVATION OF PLATELETS.

-!- CATALYTIC ACTIVITY: L-ARGININE + N NADPH + M O(2) = CITRULLINE + NITRIC OXIDE + N NADP(+).

-!- COFACTOR: HEME. BINDS ONE MOLE EACH OF FAD AND FMN. ALSO REQUIRES TETRAHYDROBIOPTERIN (BH4) WHICH MAY STABILIZE THE DIMERIC FORM OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sase K., Michel T.;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A. Experimental source: uterus
C. Comment: This protein synthesizes nitric oxide from L-arginine.
C. Superfamily: nitric-oxide synthase; flavodoxin homology; NADPH--ferrihemoprotein re C. Keywords: calmodulin binding; chromoprotein; FAD; flavoprotein; FMN; heme; iron; me F. 536-1124/Domain: NADPH--ferrihemoprotein reductase homology <FEH>
F. 538-674/Domain: flavodoxin homology <FLX>
F. 197/Binding site: heme iron (Cys) (axial ligand) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       R; Iwashina, M.; Hirata, Y.; Imai, T.; Sato, K.; Marumo, F.

nitric-oxide synthase (EC 1.14.13.39) 2C - human (fragment)
N.Alternate names: nitric oxide synthase II
C.Species: Homo sapiens (man)
C.Date: 24-May-1996 #sequence_revision 24-May-1996 #text_change 11-Jun-1999
C.Accession: 139204
R.Bloch, K.D.: Wolfram, J.R.: Brown, D.M.: Roberts, J.D.
Genomics 27, 526-530, 1995
A; Fitle: Three members of the nitric oxide synthase II gene family (NOS2A, NOS2B, and NC A; Reference number: A57622; MUID:96047340
A; Reference number: A57622; MUID:96047340
A; Status: preliminary; translated from GB/EMBL/DDBJ
A; Molecule type: DNA
A; Residues: 1-69 <a href="https://docsa.references: EMBL:U1835">docsa.references: EMBL:U1835</a>; NID:91050946; PIDN:AAC50245.1; PID:91050948

                                                                                                               This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and

The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the

Inhibition of cytokine mediated immunotoxicity of cells can be achieved by blocking free radical production or the accumulation of free radicals in that cell. Treatment of insulin dependent diabetes mellitus (IDDM) can be achieved by by blocking nitric oxide (NO) production in a pancreatic beta cell and by providing a composition comprising an agent that reduces levels of fatty acids in the cells and protects beta-cells of the subject against lipid-mediated cells and protects beta-cells of the subject against lipid-mediated cells can also be protected against nitric oxide mediated cytotoxicity by introducing into the cell an antioxidising agent. The methods can be used for protecting cells against immunotoxicity mediated by, e. g. IL-1 beta, IL-1 alpha, gamma IFN, IR-7 IL-1,

The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. Human chondrocytes were incubated with interleukin-1-beta to induce nitric-oxide-synthase. CDNA was generated and used to construct a library in lambda ZAPII. This was screened with a 650 bp fragment of mouse inducible NO-synthase cDNA to identify the full-length clone pBSHSINOS. The insert was transferred to pSVL to give a vector capable of expressing NO-synthase in CHO cells under control of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           An inducible nitric oxide syntase (1NOS = AAR88464) is the product

The original source was induced human hepatocyte RNA. HINOS CDNA plasmid is pref. transformed in E. coli SOLK (ATCC 69126). The inventors claim a clone with the CDNA sequence in AAQ66914 and a CDNA clone which encodes AAR55764. The cloning and expression of a human tissue nitric oxide synthase CDNA provides a source of the enzyme for therapeutic purposes, for example to prevent the hypotensive shock seen with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                 Sequence encoded by the cDNA clone for human hepatocyte inducible nitric oxide synthase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This protein comprises human penis inducible nitric oxide synthetase (HPINOS). Its amino acid sequence was deduced from a cDNA clone (see AAT98199) derived from human penile smooth muscle cell mRNA. The invention is directed to a method of treating erectile dysfunction in a patient by providing an agent capable of treating erectile dysfunction, and introducing an effective amount of the agent into the penile tissue of the patient. Preferably, the agent induces cavernosal smooth muscle relaxation, and/or produces an increase in the level of NOS in tissue. Preferably, the NOS is iNOS, and the agent is introduced into the corpora cavernosa of the penis. The agent is preferably an NOS inducer, an NOS protein such as HPINOS, a cDNA encoding an NOS such as HPINOS, or CDNA transformed penile cells, especially corpora cavernosa
                                                                                                                                                                                                 Gaps
of a cDNA clone (AAT10115) derived from human hepatocytes induced for INOS biosynthesis. The iNOS can be obtd. by expression of the cDNA e.g. in mammalian host cells and is used in the development of selective inhibitors of NOS or to treat diseases affected by nitric oxide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treatment of erectile dysfunction - by introducing an agent into penile tissue, particularly for inducing cavernosal smooth muscle relaxation or increasing NOS levels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               erectile dysfunction; impotence; gene therapy; corpora cavernosa;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The specification describes a method for gene therapy for enhancing and inducing angiogenesis. The method uses a nucleic acid delivery vehicle, which comprises a nucleic acid encoding nitric oxide synthase (NOS). The delivery vehicle is used for the manufacture of a pharmaceutical composition for isolated tissue perfusion treatment. The method is useful for enhancing and/or inducing angiogenesis in patients with endothelial dysfunctions, in particular arteriosclerosis. The present sequence represents an inducible NOS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS potent in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inducible; nitric oxide synthase; iNOS; human; immunoassay; detection; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autocimmune disease; multiple sclerosis; epitope mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes an immunoassay method where a sample with a

                             This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNoS) or mimics of this protein is used to detect the presence of human iNoS protein in the sample. The method can be used for the detection and quantitation of human iNoS in cells and tissues for various pathophyslological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNoS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (inOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic
tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Description

-!- FUNCTION: PPIASES ACCELERATE THE FOLDING OF PROTEINS.

-!- CATALYTIC ACTIVITY: CIS-TRANS ISOMERIZATION OF PROLINE IMIDIC PEPTIDE BONDS IN OLIGOPEPTIDES.

-!- ENZYME REGULATION: INHIBITED BY CYCLOSPORIN A (CSA).

-!- SIMILARITY: BELONGS TO THE CYCLOPHILIN-TYPE PPIASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

--- ENZYME REGULATION REGULATED BY CALCIUM/CALMODULIN (IN CONTRAST WITH MOUSE NOS2). ASPIRIN INHIBITS EXPRESSION AND FUNCTION OF THIS ENZYME AND EFFECTS MAY BE EXERTED AT THE LEVEL OF TRANSLATIONAL/POSTTRANSLATIONAL MODIFICATION AND DIRECTLY ON THE CATALYTIC ACTIVITY (BY SIMILARITY).

--- SUBGNIT: HOMODIMER.

--- SUBGNIT: HOMODIMER.

--- TISSUE SPECIFICITY: EXPRESSED IN THE LIVER, RETINA, BONE CELLS AND AIRMAY EPITHELIAL CELLS OF THE LUNG. NOT EXPRESSED IN THE NITRIC OXIDE + N NADP(+).
-1- COFACTOR: HEME. BINDS ONE MOLE EACH OF FAD AND FMN. ALSO REQUIRES TETRAHYDROBIOPTERIN (BH4) WHICH MAY STABILIZE THE DIMERIC FORM OF WITH DIVERSE FUNCTIONS THROUGHOUT THE BODY. IN MACROPHAGES, NO MEDIATES TUMORICIDAL AND BACTERICIDAL ACTIONS.

CATALYTIC ACTIVITY: L-ARGININE + N NADPH + M O(2) - CITRULLINE + PRINTS; PR00369; FLAVODOXIN.
PRINTS; PR00371; FPNOR.
OXIGOTE GOVERNER:
Heme; Phosphorylation; Zinc; Metal-binding; Multigene family; (BY CAPK) (POTENTIAL).
(BY CAPK) (POTENTIAL).
(BY CAPK) (POTENTIAL). FMN (PYRIMIDINE PART) (BY SIMILARITY). FAD (ADP PART) (BY SIMILARITY). FAD (FLAVIN PART) (BY SIMILARITY).
NADP (RIBOSE PART) (BY SIMILARITY).
NADP (ADP PART) (BY SIMILARITY). CALMODULIN-BINDING (POTENTIAL) -!- INDUCTION: BY TREATMENT WITH ENDOTOXINS OR CYTOKINES. 6 AND 4 ZINC.

-1- FUNCTION: PRODUCES NITRIC OXIDE (NO) WHICH IS A MESSENGER MOLECULE WITH DIVERSE FUNCTIONS THROUGHOUT THE BODY. IN MACROPHAGES, NO MEDIAPES TUNORICIDAL ACTIONS.

-1- CATALYTIC ACTIVITY: L-ARGININE + N NADPH + M O(2) = CITRULLINE + NITRIC OXIDE + N NADPH+).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ENZYME REGULATION: NOT STIMULATED BY CALCIUM/CALMODULIN. ASPIRIN HINHIBITS EXPRESSION AND FUNCTION OF THIS ENZYME AND EFFECTS MAY BE EXERTED AT THE LEVEL OF TRANSLATIONAL/POSTTRANSLATIONAL MODIFICATION AND DIRECTLY ON THE CATALYTIC ACTIVITY.

Submitted (MAR-1999) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: MAY FACILITATE THE PROGRESSION OF ANAPHASE THROUGH
DIRECT OR INDIRECT INTERACTION WITH THE CUTB PROTEIN.
-!- SIMILARITY: WITH THE CONSERVED CATALYTIC DOMAINS OF SER/THR-
PROTEIN KINASES. STRONG, TO YEAST RIMIS.

-!- FUNCTION: CYTOCHROMES P450 ARE A GROUP OF HEME-THIOLATE
MONOOXYGENASES. THEY OXIDIZE A VARIETY OF STRUCTURALLY UNRELATED
COMPOUNDS, INCLUDING STEROIDS, FATTY ACIDS, AND XENOBIOTICS.
-!- SIMILARITY: BELONGS TO THE CYTOCHROME P450 FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         hypothetical protein F13D11.2 - Caenorhabditis elegans
C;Species: Caenorhabditis elegans
C;Species: Caenorhabditis elegans
C;Species: 20-Sep-1999 #sequence_revision 20-Sep-1999 #text_change 23-Mar-2001
C;Accession: T16057
R;Pulton, L.
Submitted to the EMBL Data Library, November 1995
A;Description: The sequence of C. elegans cosmid F13D11.
A;Reference number: S69020
A;Accession: T16057
A;Status: preliminary; translated from GB/EMBL/DDBJ
A;Molecule type: DNA

                                                                                                                                                                                                                                                                                                                 ó
                                                       specific bidding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (inds) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inducible; nitric oxide synthase; iNOS; human; immunoassay; detection; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiple sclerosis.
                                                                                                                                                                                                                                                                                                                 Gaps
                                            invention describes an immunoassay method where a sample with a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence
tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psorlasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Inducible nitric oxide synthase; INOS; human; immunoassay; detection; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiple sclerosis.

chemoattractant protéin-1. The methods can be used for the treatment of e.g. insulin-dependent diabetes mellitus (IDDM), NIDDM, obesity, wasting syndromes, short stature, osteoporosis, inflammatory
                                                                                                                    diabetes mellitus; treatment; therapy; nitric oxide; NO; beta cell; fatty acid; lipotoxic; cytotoxic; cytokine; osteoporosis; inflammatory disease; autoimmune disease; neurodegenerative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Protection of mammalian cells against immunotoxicity or lipotoxicity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                achieved by blocking free radical memoration of free radicals in that cell. Treatment of insulin dependent diabetes mellitus (IDDM) can be achieved by by blocking nitric oxide (NO) production in a pancreatic beta cell and by providing a composition comprising an agent that reduces levels of fatty acids in the cells and protects beta cells of the subject against lipid-mediated cell death. Cells can also be protected against lipid-mediated cell death. Cells can also be protected against intric oxide mediated cytotoxicity by introducing into the cell an antioxidising agent. The methods can be used for protecting cells against immunotoxicity mediated by, e. g. 1L-1 beta. 1L-1 alpha, agamma IFN, TNF alpha, granulocyte-macrophage colony stimulating factor or monocyte

    used for treating, e.g. diabetes, obesity, wasting syndromes,
osteoporosis, inflammatory diseases, autoimmune diseases or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (1NOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the

```
nitric-oxide-synthase. cDNA was generated and used to construct a library in lambda ZAPII. This was screened with a 650 bp fragment of mouse inducible NO-synthase cDNA to identify the full-length clone pBSHSINOS. The insert was transferred to pSVL to give a vector capable of expressing NO-synthase in CHO cells under control of a heterologous constitutive promoter.
                                                                                                                                                                                                                                                                                                     Human chondrocytes were incubated with interleukin-1-beta to induce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       An inducible nitric oxide syntase (iNOS - AAR88464) is the product

                                                                                                                                ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This protein comprises human penis inducible nitric oxide synthetase (HPINOS). Its amino acid sequence was deduced from a compa clone (see AAT98199) derived from human penile smooth muscle cell mRNA. The invention is directed to a method of treating crectile dysfunction in a patient by providing an agent capable of treating erectile dysfunction, and introducing an effective amount of the agent into the penile tissue of the patient. Preferably, the agent into the penile tissue of the patient. Preferably, the NoS is iNOS, and the agent is introduced into the corpora cavernosa of the penis. The agent is introduced into the corpora cavernosa of the penis. The agent is preferably an NOS inducer, an NOS protein such as HPINOS, a cDNA transformed penile cells, especially corpora cavernosa
                                                                                                                               Gaps
of a cDNA clone (AAT10115) derived from human hepatocytes induced for iNOS biosynthesis. The iNOS can be obtd. by expression of the cDNA e.g., in mammalian host cells and is used in the development of selective inhibitors of NOS or to treat diseases affected by nitric oxide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treatment of erectile dysfunction - by introducing an agent into penile tissue, particularly for inducing cavernosal smooth muscle relaxation or increasing NOS levels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid delivery vehicle comprising a nucleic acid encoding nitric oxide synthase, used for isolated tissue perfusion treatment to enhance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The specification describes a method for gene therapy for enhancing and inducing anglogenesis. The method uses a nucleic acid delivery vehicle, which comprises a nucleic acid encoding nitric oxide synthase (NOS). The delivery vehicle is used for the manufacture of a pharmaceutical composition for isolated tissue perfusion treatment. The method is useful for enhancing and/or inducing anglogenesis in patients with endothelial dysfunctions, in particular arteriosclerosis. The present sequence represents an inducible NOS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to use of a nucleic acid delivery vehicle comprising a nucleic acid encoding nitric oxide synthase (NOS) activity for the manufacture of a composition for essentially isolated tissue perfusion treatment to enhance and/or induce angliogenesis. The nucleic acid delivery vehicle is particularly useful in gene therapy for the treatment of atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inducible; nitric oxide synthase; iNOS; human; immunoassay; detection; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autofimmune disease; multiple sclerosis; epitope mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                               Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human iNOS or mimics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human iNOS or mimics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .;

                                                                                                                                                                                      õ
                                                                                                                                                                                                                                                                                                                                                                        ö
                                                    This invention describes an immunoassay method where a sample with a specific binding entiry (e.g. a monoclonal antibody) reactive to human inductible nitric oxide synthase (iNOS) or mindcs of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in calls and tissues for various pathophysiclogical conditions such as sepsis, septic shock myocardial infarction, rejection of tissue in organs following such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autofimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the
